

## How To Import Immunizations (BiDirectional ShowMeVax Interface)

1. Open the patient Immunization module (through the progress note or Hub)
2. On the right side of the imms module, you will see the Patient Demographics, History & Recommendations.

3. Identify which immunizations need added to the eCW immunization record.
  - a. Note: imms given at KTCH and documented in eCW will show on the right side listing as we are importing these into ShowMeVax realtime.
4. Select the orange arrow next to the immunization to load into the patient's eCW imm list
  - a. You will receive an alert if the imm is already listed in eCW
  - b. If there are multiple options for that immunization listed, you will choose the one that fits the system. I.e. Hep B VFC vs Non VFC

### Q&A-

- The patient shows **No Patient Found** on the right panel.
  - A: This means the patient doesn't have any imms documented in ShowMeVax
- There are multiple patients listed
  - A: This means there are multiple similar or duplicate patients in ShowMeVax. Select the correct one and then load the immunizations.
